This supplemental appendix provides detailed correspondences between the Bureau of Economic Analysis (BEA) benchmark input-output (IO) tables at various aggregations and years and the 1987 4-digit Standard Industrial Classification (SIC) codes used in the National Bureau of Economic Research–Center for Economic Studies (NBER-CES) Manufacturing Industry Database (MID).

1 IO-SIC Correspondence

We develop a correspondence between the 6-digit IO code–based IO data and the 4-digit SIC code–based MID data. The ultimate correspondence is between 4-digit IO and 4-digit SIC codes, but aggregation is required in both data sets to achieve a one-to-one correspondence. Aggregation is preformed at the most detailed level possible. The merged database contains 272 industries at the 4-digit SIC level.

The tables below provide details of the aggregation and the final correspondence. The tables are also available in spreadsheet form (.csv).

1.1 Combined IO Codes

To create a complete correspondence, we occasionally need to assign a 6-digit IO code to a different 4-digit IO code for aggregation. For example, in the 1967 IO table, IO codes 170200 (“felt goods, n.e.c.”), 170300 (“lace goods”), 170400 (“padding & upholstery filling”), and so forth are assigned to 4-digit IO code 1710 (“textile goods, n.e.c.”) for final aggregation. This is required because no such industries existed at the 4-digit SIC level.

The tables below report which 6-digit IO codes are assigned to which 4-digit IO codes before aggregating to the 4-digit IO level. This assignment changes for each benchmark IO table. We aggregate the nominal value of shipments by summing the component sectors.

1.2 Combined SIC Codes

Some SIC codes also require combination. This aggregation occurs mostly at the 3-digit SIC level, which roughly corresponds to the 4-digit IO level, but it is ultimately tailored to preserve the best correspondence with the IO data.

The real quantities were defined at the industry level as the nominal quantities divided by the relevant price index. Because the price indices in this data base are fixed-weight indices, it is possible to sum the real quantities. We then summed nominal and real quantities for the combined industries and used their ratios to construct price indices.

The table below shows which 4-digit SIC codes are combined into a single sector. The combined value of the sectors in the source column is assigned to the SIC code listed in the destination column.
